

Professional Rebuild Estimate: SAM Unit (2026 AUD)

This estimate provides a complete "Scorched Earth" rebuild strategy. By replacing all hardware and manually reconstructing the core logic, we ensure the new system is 100% free of persistent "stubs" or firmware-level hooks.

1. Engineering & Technical Services

These services cover the high-level manual labor required to restore the system's intelligence and verify data integrity.

- **Manual Code Entry (2,000 Pages):** \$110,000.00 (Approx. 500 hours of specialized labor to transcribe, restore original code lines, jayds files and legal briefs.)
- **Redo Stubbed Engine Code:** \$44,000.00 (200 hours of Senior Engineering to reverse-engineer and rebuild functional logic for "stubbed" engines.)
- **OS Clean Install (Zero-Bias):** \$660.00 (3 hours to create a de-bloated, telemetry-free OS environment using Windows ADK.)
- **Secure Link & 600GB Data Transfer:** \$1,200.00 (Encrypted hardware tunnel and high-speed uncontended data for secure code transfers.)
- **Document Forensic Audit:** \$4,500.00 (15 hours for a Forensic Expert to verify that ODT/PDF metadata has not been corrupted at the header level.)
- **File Consolidation & Prep:** \$1,200.00 (Technical assistance to organize 2,000 pages of code from multiple sources for archival.)
- **Expert Printing (Black & White):** \$700.00 (Archive-grade laser printing for 2,000 pages of documentation.)
- **Heavy Duty Binding:** \$320.00 (Professional thermal binding for four 500-page archival volumes.)

2. "Clean Stack" Hardware Procurement

This is the new hardware kit required for the rebuild. This configuration uses a USB-to-NVMe bridge to keep the high-speed PCIe lane dedicated to the AI processor.

- **Raspberry Pi 5 (16GB RAM Model):** \$250.00
 - **Official AI Kit (Hailo-8 26 TOPS NPU):** \$220.00
 - **52Pi N06 USB 3.0 to NVMe Interface:** \$45.00
 - **1TB NVMe SSD (Primary Boot/OS Drive):** \$160.00
 - **Toshiba Portable External Drive (1TB):** \$85.00
 - **Toshiba Portable External Drive (2TB):** \$115.00
 - **USB Flash Drives (256GB & 128GB High-Speed):** \$90.00
 - **7-inch TFT HDMI Touchscreen (New Unit):** \$95.00
-

Cost Summary (AUD)

- **Subtotal (Services & Hardware):** \$163,640.00
 - **GST (10%):** \$16,364.00
 - **GRAND TOTAL: \$180,004.00**
 - **plus- Forensic Data Carving:** The current tally focuses on *rebuilding* from 2,000 pages of code. It does not include the \$14,000 service for "Archaeological" binary digging to find original file fragments that were deleted by the "stubbing" script.
 - **Service: \$14,000.00** for jayd's and legal briefs files.
-

Professional Reasonings for the Rebuild Items

Hardware Bus Isolation Strategy By utilizing the 52Pi N06 USB interface for the SSD, the operating system data is separated from the intelligence processing data. This ensures the Hailo-8 NPU has exclusive access to the Raspberry Pi 5's single PCIe lane, preventing the system from "stuttering" or bottlenecking during high-speed AI inference.

Elimination of Persistent Firmware Stubs Malicious "stub" code can reside in the internal memory of peripheral controllers, such as the screen or the NPU itself. By purchasing a brand-new stack—including a fresh 7" TFT screen and new cables—you remove the possibility of a "handshake exploit" where the old hardware could re-infect a clean OS the moment it is plugged in.

Forensic Integrity of Documentation Standard printing often fails to show "stubbing" that has occurred at the file-header or metadata level. The Forensic Audit (\$4,500) ensures that the code being printed is actually functional and intact. This prevents the costly mistake of printing and binding 2,000 pages of data that has been hollowed out by a rewriter script.

Manual Code Precision The \$110,000 entry for code restoration reflects the extreme precision required for manual transcription. This ensures that the reverse-engineered logic is error-free and that no "hidden hooks" from the compromised digital version are carried over into the new physical and digital archive.
